5 Critical Security Advantages with ARIA ADR

A single platform for enterprise-wide automated threat detection and containment
The ARIA Advanced Detection and Response (ADR) application provides superior threat detection and containment functionality in a single, purpose-built solution. It finds, validates, and stops threats — no SOC required.

**1 | Complete Visibility**

ARIA ADR provides *complete visibility* to every corner of your network, where other solutions are limited or completely blind. If it’s communicating internally, ARIA ADR sees it using the integrated ARIA SDS Packet Intelligence (PI) application. This allows ARIA ADR to find the most harmful threats faster and earlier in the attack lifecycle (or kill chain) before they can do significant damage.
2 | Enterprise-wide Analytics

To find threats quickly and accurately, the ARIA ADR solution uses the industry's most comprehensive analytics generated from alerts, logs, threat intelligence and our own ARIA PI application. Without this capability, it would typically require an investment in SIEM, UEBA, NTA, IDS, and threat intel solutions to provide a similar approach. But these tools inevitably lead to an overabundance of noise (extraneous alerts), making it nearly impossible to find threats quickly, if at all.

3 | Smart Threat Modeling

From there, the ARIA ADR application makes this wealth of information manageable by utilizing artificial intelligence (AI) to feed it through machine learning (ML) based predefined threat models that understand how each threat behaves. The application quickly identifies all suspicious activities and correlates them to produce incredibly accurate results by eliminating false positives and producing valid alerts. All of this is done automatically with no human effort required. This is a major advantage over typically rules-based SIEM solutions that need constant updating.
4 | Surgical Threat Containment

The AI capabilities within ARIA ADR automatically contain these threats before they can spread to other devices. This is critical in stopping the spread of attacks like ransomware or protecting exposed legacy operating systems or IoT devices that can’t support security applications like EDR. ARIA ADR enables organizations to stop these attacks with full or partial automation and little to no human intervention.

Security professionals can deactivate a user or a device’s compromised credentials, block attacks at the firewall to isolate infected devices from the network, or even contain threats by stopping their network conversations. This enables business-critical resources to stay operational and buys time to get back-up systems in place before taking compromised systems down.

5 | Automated and Auditable Enforcement

Finally, ARIA ADR is also valuable for assuring regulatory compliance and enforcing connectivity policies – preventing future violations. This gives organizations a solution that provides a superior, longer-lasting security posture, one that will evolve with and stay ahead of attacks, even as they become more sophisticated.
ABOUT ARIA CYBERSECURITY SOLUTIONS

ARIA Cybersecurity Solutions recognizes that better, stronger, more effective cybersecurity starts with a smarter approach. Our solutions provide new ways to monitor all internal network traffic, while capturing and feeding the right data to existing security tools to improve threat detection and surgically disrupt intrusions. Customers in a range of industries rely on our solutions each and every day to accelerate incident response, automate breach detection, and protect their most critical assets and applications. With a proven track record supporting the Department of Defense and many intelligence agencies in their war on terror, and an award-winning portfolio of security solutions, ARIA Cybersecurity Solutions is committed to leading the way in cybersecurity success.
